Preface	ix
1 A Review of Progress on Direct and Large-Eddy Simulation	1
<i>N.D. Sandham</i>	
1.1 Background	1
1.2 Direct numerical simulations of turbulence	2
1.2.1 Turbulence scales and resolution requirements	2
1.2.2 Validation procedures	4
1.2.3 The changing perspective of computer hardware	4
1.2.4 Applications	5
1.3 Large-eddy simulations	8
1.3.1 Background: Smagorinsky and dynamic models	8
1.3.2 Engineering and atmospheric applications	10
1.3.3 New theoretical developments	11
1.4 Conclusions	16
1.4.1 Guidelines for application of current LES technology	16
1.4.2 Key issues and requirements for future research	17
2 Deconvolution Methods for Subgrid-Scale Approximation in LES	21
<i>N.A. Adams, S. Stolz</i>	
2.1 Introduction	21
2.2 Filtering approach: soft and hard deconvolution problem	23
2.2.1 The filtered conservation law	23
2.2.2 Filter-kernel definitions	26
2.3 Regularized deconvolution	29
2.3.1 Deconvolution methods from image processing	29
2.3.2 Review of deconvolution-type subgrid-scale models	31
2.3.3 The approximate deconvolution model	36
2.4 Secondary regularization	38
2.5 Conclusions	41
3 The subgrid-scale estimation model for decaying isotropic turbulence	45
<i>P. P. Yee, J. A. Domaradzki</i>	
3.1 Introduction	45
3.2 Previous formulation of subgrid scale estimation procedure	46
3.3 A Modified Formulation of the Velocity Estimation Procedure	49
3.4 Simulations Using the Improved Velocity Estimation Procedure	50
3.5 Conclusions	55

4	The spatial velocity increment as a tool for SGS modeling	57
	<i>C. Brun, R. Friedrich</i>	
4.1	Introduction	57
4.2	Properties of the Subgrid Scale Stress Tensor	58
4.2.1	Definition of a general filter	58
4.2.2	Governing Equations of the Flow	59
4.2.3	3D Taylor Expansion of the SGS Stress Tensor	59
4.2.4	Relation between the Generalized Leonard Stress Tensor and the SGS stress tensor	60
4.2.5	Filtering in time	61
4.3	The INC model: from a 1D to a 3D formulation	62
4.3.1	Temporal approach	62
4.3.2	Spatial 1D-approach	63
4.3.3	Spatial 3D-approach	64
4.4	A priori tests of the INC model	66
4.4.1	Mean value of the SGS stress tensor	66
4.4.2	Properties of the model in terms of the SGS Energy production	67
4.5	A posteriori tests of the INC model	68
4.5.1	An alternative Dynamic Procedure	68
4.5.2	LES of fully developed pipe flow at $180 < \nu < \text{Re} < 520$	69
4.6	Sensitivity analysis of the INC model	78
4.6.1	Decoupling numerics from model effect	78
4.6.2	Amplitude of the model coefficient	80
4.7	Conclusions and Outlook	80
5	Tensor-diffusivity mixed model: balancing reconstruction and truncation	85
	<i>G. S. Winckelmans, H. Jeanmart, A. A. Wray, D. Carati, B. J. Geurts</i>	
5.1	Introduction	86
5.2	Definitions, filtered-scale stress and subgrid-scale stress	86
5.3	Approximate reconstruction, tensor-diffusivity and mixed modeling	89
5.4	Theoretical aspects of the mixed model	91
5.5	Ties with other models	92
5.6	The dynamic procedure applied to the mixed model	93
5.7	Results for LES of isotropic turbulent decay	94
5.7.1	The tensor-diffusivity model alone	95
5.7.2	The mixed model	97
5.7.3	Spectrum of dissipation	99
5.7.4	More challenging LES	101
5.8	Conclusions	101

6	Navier-Stokes-alpha model: LES equations with nonlinear dispersion	107
	<i>J. A. Domaradzki, D.D. Holm</i>	
6.1	Introduction	107
6.2	Kelvin-filtered turbulence models	109
6.3	Comparison of the NS- α model with LES equations	112
6.4	Transformation properties	114
6.5	Relation to generalized similarity models	116
6.6	Spectral space interpretation	119
7	Rotational transformation and geometrical correlation of SGS models	123
	<i>K. Horiuti</i>	
7.1	Introduction	123
7.2	Subgrid-scale stress tensor in rotating frame	125
7.2.1	Formulation of the generalized scale-similarity model	126
7.2.2	Compatibility of the models with rotational constraint	127
7.2.3	Assessment in homogeneous turbulence subjected to rotation	130
7.2.4	Higher-order models for the modified cross term	131
7.3	Assessment of subgrid models in dissipative vortical structures	133
7.3.1	Classification method and DNS data analysis	134
7.3.2	Assessment of the SGS models	136
7.4	Conclusions	138
8	Renormalization-type methods applied to the simulation of turbulence	141
	<i>W. D. McComb</i>	
8.1	Introduction	141
8.2	Statement of the problem	143
8.2.1	Basic spectral equations	143
8.2.2	The energy spectrum and mode elimination	145
8.2.3	Need for a conditional average	148
8.3	Conservation equations for the explicit scales	149
8.3.1	Ensemble-averaged conservation equations and the ad hoc effective viscosity	150
8.3.2	Conditionally-averaged conservation equations	151
8.3.3	Quasi-stochastic estimate of the renormalized dissipation rate	153
8.4	Conditional mode elimination and scale invariant dissipation	154
8.4.1	Numerical results and discussion	156
8.5	Effective viscosity in a constrained simulation	157
8.5.1	The direct numerical simulation	157
8.5.2	The constrained simulation	159

8.6	The local energy transfer (LET) theory	163
8.6.1	The LET equations and the test problems	163
8.6.2	Freely Decaying Turbulence	165
8.6.3	Forced Turbulence	165
8.7	Discussion	168
9	Ten years of the dynamic model	173
	<i>M. Germano</i>	
9.1	Introduction	173
9.2	The origin of the dynamic model	175
9.3	Symbols: horizontal and vertical notations	176
9.4	The dynamic procedure: various contributions and problems	178
9.5	Criticism	182
9.6	Realizability and reversibility	183
9.7	The renormalized filter and associated renormalized model	185
9.8	Future strategies: additive dynamic procedures	186
9.9	Conclusions	188
10	Computation of the lobe-and-cleft instability	191
	<i>C. Haertel, M. Thunblom, F. Carlsson</i>	
10.1	Introduction	191
10.2	Mathematical Approach	193
10.3	Two-dimensional base flow	195
10.4	Linear-stability analysis	196
10.4.1	Computational approach	198
10.4.2	Discussion of the stability results	199
10.5	Direct numerical simulations	201
10.6	Concluding Remarks	204
11	Wall-layer models for LES of separated flows	207
	<i>G.V. Diurno, E. Balaras, U. Piomelli</i>	
11.1	Introduction	207
11.2	Formulation	212
11.2.1	Numerical method and subgrid-scale model	212
11.2.2	The Two-Layer Model	212
11.3	Results	214
11.4	Conclusions	221
12	VLES of flows driven by thermal buoyancy and magnetic field	223
	<i>K. Hanjalic and S. Kenjeres</i>	
12.1	Introduction	223
12.2	VLES methods	224
12.3	Classic and magnetic Rayleigh-Bénard convection: a case for VLES	226

12.3.1 Effects of a magnetic field	227
12.3.2 Flows considered	229
12.4 Mathematical Rationale	229
12.4.1 The subscale model	230
12.4.2 Evaluation of turbulent heat flux	232
12.4.3 Numerical method	233
12.5 Illustrations	233
12.6 Conclusions	243
13 DNS of non-premixed combustion in a compressible mixing layer	247
<i>R.J.M. Bastiaans, L.M.T. Somers, H.C. de Lange</i>	
13.1 Introduction	247
13.2 Governing equations	248
13.3 Numerical method	250
13.4 Problem definition and validation	250
13.5 Results	251
13.6 One-dimensional flamelets	255
13.7 Flamelet analysis	257
13.8 Conclusions	259
14 DNS and LES of Turbulence-Combustion Interactions	263
<i>K. H. Luo</i>	
14.1 Introduction	263
14.2 Direct Numerical Simulation	265
14.3 Large Eddy Simulation	269
14.4 DNS of High Speed Combustion	273
14.4.1 Heat Release Effects	274
14.4.2 Combustion-Generated Turbulence	279
14.4.3 Counter-gradient Diffusion	280
14.5 DNS and LES of Low Speed Combustion	283
14.5.1 DNS of Fires	284
14.5.2 LES of Thermal and Fire Plumes	287
14.6 Summary	289
15 Large Eddy Simulation of compressible turbulent jets	295
<i>B.J. Boersma</i>	
15.1 Introduction	295
15.2 Large Eddy Simulation	296
15.2.1 LES models	298
15.2.2 The dynamic procedure	299
15.3 Numerical method and boundary conditions	300
15.3.1 Inflow conditions	301
15.4 Results	302
15.5 Conclusion	306

16 Numerical effects contaminating LES; a mixed story	309
<i>B.J. Geurts , J. Froehlich</i>	
16.1 Introduction	309
16.2 Reference DNS and LES of a temporal mixing layer	312
16.3 Refining the grid at constant filterwidth	315
16.4 Refining the grid at constant filterwidth to mesh-spacing ratio	320
16.5 Discussion of results and cost	322
